2181

SHORTENED STATUTORY PERIOD OF RESPONSE	MAIL DATE	DELIVERY MODE
3 MONTHS	01/25/2007	PAPER

**Please find below and/or attached an Office communication concerning this application or proceeding.**

If NO period for reply is specified above, the maximum statutory period will apply and will expire 6 MONTHS from the mailing date of this communication.

<b>Office Action Summary</b>	<b>Application No.</b> 10/737,191	<b>Applicant(s)</b> MYLLY ET AL.	
	<b>Examiner</b> Richard Franklin	<b>Art Unit</b> 2181	

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --

#### Period for Reply

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) OR THIRTY (30) DAYS, WHICHEVER IS LONGER, FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

#### Status

- 1) ☒ Responsive to communication(s) filed on 30 October 2006.
- 2a) ☐ This action is FINAL. 2b) ☒ This action is non-final.
- 3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

#### Disposition of Claims

- 4) ☒ Claim(s) 1-4,6-11,13,14 and 16-20 is/are pending in the application.
- 4a) Of the above claim(s) \_\_\_\_\_ is/are withdrawn from consideration.
- 5) ☐ Claim(s) \_\_\_\_\_ is/are allowed.
- 6) ☒ Claim(s) 1-4,6-11,13,14 and 16-20 is/are rejected.
- 7) ☐ Claim(s) \_\_\_\_\_ is/are objected to.
- 8) ☐ Claim(s) \_\_\_\_\_ are subject to restriction and/or election requirement.

#### Application Papers

- 9) ☐ The specification is objected to by the Examiner.
- 10) ☐ The drawing(s) filed on \_\_\_\_\_ is/are: a) ☐ accepted or b) ☐ objected to by the Examiner.  
Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).  
Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).
- 11) ☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

#### Priority under 35 U.S.C. § 119

- 12) ☐ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
- a) ☐ All b) ☐ Some \* c) ☐ None of:
1. ☐ Certified copies of the priority documents have been received.
  2. ☐ Certified copies of the priority documents have been received in Application No. \_\_\_\_\_.
  3. ☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).
- \* See the attached detailed Office action for a list of the certified copies not received.

#### Attachment(s)

**DETAILED ACTION**

1. Claims 1 – 4, 6 – 11, 13 – 14, and 16 – 20 are pending.

***Response to Arguments***

2. Applicant's arguments with respect to claims 1 – 4, 6 – 11, 13 – 14, and 16 – 20 have been considered but are moot in view of the new ground(s) of rejection.

***Continued Examination Under 37 CFR 1.114***

3. A request for continued examination under 37 CFR 1.114, including the fee set forth in 37 CFR 1.17(e), was filed in this application after final rejection. Since this application is eligible for continued examination under 37 CFR 1.114, and the fee set forth in 37 CFR 1.17(e) has been timely paid, the finality of the previous Office action has been withdrawn pursuant to 37 CFR 1.114. Applicant's submission filed on 30 October 2006 has been entered.

***Claim Rejections - 35 USC § 101***

- 35 U.S.C. 101 reads as follows:

Whoever invents or discovers any new and useful process, machine, manufacture, or composition of matter, or any new and useful improvement thereof, may obtain a patent therefor, subject to the conditions and requirements of this title.

4. Claims 1 – 3, 6 – 10, 14, and 16 are rejected under 35 U.S.C. 101 because the claims fail the practical application test. The claims recite data transformation per se with no tangible result.

As per claims 1 – 4, 6 – 10, 14, and 16, the claims recite non-statutory subject matter that is directed solely to data transformation with no claimed tangible result. The result of the claims appear to be a thought (obtaining) or a mere computation within a processor rather than a real world tangible result that is a practical application of the abstract idea of “obtaining.”

It is recommended that applicant amend the claims to include a step of conveying, storing, or using the common initialization timeout value to perform specific operation. For example, transmitting the value to another part of the system or storing the value would overcome the rejection. Also, using the value to, for example, adapt a polling frequency, such as recited in claim 4, would overcome the rejection because the value is used to perform an operation and not just obtained.

### ***Claim Rejections - 35 USC § 102***

The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(e) the invention was described in (1) an application for patent, published under section 122(b), by another filed in the United States before the invention by the applicant for patent or (2) a patent granted on an application for patent by another filed in the United States before the invention by the applicant for patent, except that an international application filed under the treaty defined in section 351(a) shall have the effects for purposes of this subsection of an application filed in the United States only if the international application designated the United States and was published under Article 21(2) of such treaty in the English language.

5. Claims 1 – 3, 11, 13 – 14, 17 – 20 are rejected under 35 U.S.C. 102(e) as being anticipated by US Patent Application Publication No. 2003/0212857 (hereinafter Pacheco).

As per claim 1, Pacheco teaches a method comprising transmitting information (Figure 5B "BYTE 4-5 and 6-7") indicative of a time required for an initialization of a respective one of at least two peripheral devices (Figure 2 Items 222, and 226a – 226n) from each of the at least two peripheral devices (Paragraph [0040] Lines 12 – 15); electrically combining the information from each of the at least two peripheral devices to produce combined information indicating a time which is required at the most by any of the at least two peripheral devices for its respective initialization (Figure 8A "Max Spin-Up Period", Paragraph [0047] Lines 4 – 7); and using the combined information for obtaining a common initialization timeout value for the at least two peripheral devices (Paragraph [0049] Lines 25 – 28).

As per claim 2, Pacheco also teaches wherein the information indicative of the time required for the initialization of the respective one of the at least two peripheral devices is an information indicative of the time required for the initialization of the respective one of the at least two peripheral devices at a maximum under regular circumstances (Figure 5B "BYTE 4-5, Typical Start Time (ms)", Paragraph [0034] Lines 7 – 9).

As per claim 3, Pacheco also teaches wherein at least one of the at least two peripheral devices transmits the information to the host device upon a predetermined command received from the host device (Figure 5A Item 500, Paragraph [0040] and Paragraph [0044] Lines 12 – 24).

As per claim 11, Pacheco teaches a bus (Figure 2 Item 202) configured to receive from at least two peripheral devices (Figure 2 Items 226a – 226n) an information indicative of a time required at a respective one of the at least two peripheral devices for its respective initialization (Figure 5B “BYTE 4-5 and 6-7”) and configured to electrically combine the information to produce combined information indicating a time which is required at the most by any of the at least two peripheral devices for its respective initialization (Figure 8A “Max Spin-Up Period”, Paragraph [0047] Lines 4 – 7); an interface (Figure 2 Item 214) configured to interact with the at least two peripheral devices via the bus; and a control component (Figure 2 Item 216) configured to receive the combined information via the interface from the bus and to use the combined information for obtaining a common initialization timeout value for the at least two peripheral devices (Paragraph [0049] Lines 25 – 28).

As per claim 13, Pacheco teaches a system comprising a host device (Figure 2 Item 212) and at least two peripheral devices (Figure 2 Items 226a – 226n), each of the at least two peripheral devices including: a first interface configured to interact with the host device (The peripherals are described as SCSI drives and SCSI drives have SCSI interfaces); a storing component configured to store information indicative of a time required at a respective peripheral device for a respective initialization (Figure 2 Items 228a – 228n, Figure 5B “BYTE 4-5 and 6-7”, Paragraph [0033] Lines 1 – 6, Paragraph [0035]); and a controlling component (Paragraph [0035] “local disk drive controller”)

configured to retrieve information indicative of the time required at the respective peripheral device for the respective initialization from the storing component and configured to transmit the information via the first interface to the host device; and the host device including: a bus (Figure 2 Item 202) configured to receive from the at least two peripheral devices the information indicative of the time required at the respective peripheral device for its respective initialization and configured to electrically combine the information to produce combined information indicating a time which is required at the most by any of the at least two peripheral devices for its respective initialization (Figure 8A "Max Spin-Up Period", Paragraph [0047] Lines 4 – 7); a second interface (Figure 2 Item 214) configured to interact with the at least two peripheral devices via the bus; and a control component (Figure 2 Item 216) configured to receive the combined information via the second interface from the bus and to use the combined information for obtaining a common initialization timeout value for the at least two peripheral devices (Paragraph [0049] Lines 25 – 28).

As per claim 14, Pacheco teaches a computer program product comprising a computer readable storage structure embodying computer program code thereon for execution by a computer processor, wherein the computer program code comprises instructions for performing a method comprising: receiving combined information indicating a time which is required at the most be any of at least two peripheral devices (Figure 2 Items 226a – 226n) for its respective initialization (Figure 8A "Max Spin-Up Period", Paragraph [0047] Lines 4 – 7); and using the combined information for

Art Unit: 2181

obtaining a common initialization timeout value for the at least two peripheral devices (Paragraph [0049] Lines 25 – 28).

As per claims 17 and 19, Pacheco teaches an apparatus comprising a bus (Figure 2 Item 202) configured to electrically combine information indicative of a time required for an initialization of a respective one of at least two peripheral devices (Figure 2 Items 226a – 226n) from each of the at least two peripheral devices to produce combined information indicating a time which is required at the most be any of the at least two peripheral devices for its respective initialization (Figure 8A “Max Spin-Up Period”, Paragraph [0047] Lines 4 – 7); and a control component (Figure 2 Item 216) configured to use the combined information for obtaining a common initialization timeout value for the at least two peripheral devices (Paragraph [0049] Lines 25 – 28).

As per claims 18 and 20, Pacheco also teaches a control module configured to provide a predetermined command for transmission to at least one of the at least two peripheral devices (Paragraph [0044] Lines 12 – 24).

***Claim Rejections - 35 USC § 103***

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

6. Claim 4 is rejected under 35 U.S.C. 103(a) as being unpatentable over US Patent Application Publication No. 2003/0212857 (hereinafter Pacheco) in view of US Patent No. 5,566,351 (hereinafter Crittenden).

As per claim 4, Pacheco teaches the method as described per claim 1 (See rejection of claim 1 above).

Pacheco does not teach wherein the host device uses the common initialization timeout value for adapting a polling frequency which is to be employed for polling the at least one of the at least two peripheral devices on whether the at least one peripheral device has completed its respective initialization.

However, Crittenden teaches wherein the host device uses the common initialization timeout value for adapting a polling frequency which is to be employed for polling the at least one of the at least two peripheral devices on whether the at least one peripheral device has completed its respective initialization (Crittenden; Col 5 Lines 14 – 21).

Therefore, it would have been obvious to one of ordinary skill in the art at the time the invention was made to have modified the teachings of Pacheco to include the adaptive polling frequency because doing so allows for the system to maximize data

throughput by not permitting excessive sleep periods and simultaneously minimize central processing (CPU) load by avoiding excessive polling (Crittenden; Col 5 Lines 26 – 29).

7. Claim 6 is rejected under 35 U.S.C. 103(a) as being unpatentable over US Patent Application Publication No. 2003/0212857 (hereinafter Pacheco) in view of US Patent No. 6,964,018 (hereinafter Masui).

As per claim 6, Pacheco teaches the method as described per claim 1 using SCSI devices (See rejection of claim 1 above).

Pacheco does not teach wherein one of the peripheral devices is a memory card.

However, Masui teaches wherein a SCSI device could be a memory card (Masui; Col 13 Lines 41 – 44).

Therefore, it would have been obvious to one of ordinary skill in the art at the time the invention was made to have modified the teachings of Pacheco to include the memory card because memory cards are an example of a storage device that can be connected to a SCSI bus (Masui; Col 13 Lines 41 – 44).

8. Claims 7 – 10 are rejected under 35 U.S.C. 103(a) as being unpatentable over US Patent Application Publication No. 2003/0212857 (hereinafter Pacheco) in view of US Patent No. 6,964,018 (hereinafter Masui) and further in view of The MultiMediaCard System Specification Version 3.31 by the MMCA Technical Committee (hereinafter MMCA).

As per claims 7 – 10, Pacheco in combination with Masui teach the use of the method of claim 1 with a memory card.

Pacheco in combination with Masui does not teach wherein the memory card is a MultiMediaCard™ (MMC) system or implements MMC functions.

However, MMCA teaches the use of a MMC as a storage device (MMCA; Page 11 Paragraph 1); the peripheral devices transmit the information to the host device upon receipt of a CMD1 command from the host device (MMCA; Page 81 Section 6.3 Power Up); the peripheral devices retrieve the information from an operating condition register (OCR) of the peripheral devices (MMCA; Page 67 Section 5.1 OCR Register); and the peripheral devices transmit the information in an R3 response to the host device (MMCA; Pages 53 – 55 Section 4.9 Responses).

Therefore, it would have been obvious to one of ordinary skill in the art at the time the invention was made to have modified the teachings Pacheco in combination with Masui because the use of the MMC system allows for low costs data storage that covers a large area of applications (MMCA; Page 11 Paragraph 1).

9. Claim 14 is rejected under 35 U.S.C. 103(a) as being unpatentable over US Patent Application Publication No. 2003/0212857 (hereinafter Pacheco) in view of US Patent No. 6,233,625 (hereinafter Vander Kamp).

As per claim 16, Pacheco teaches the method as described per claim 1 using SCSI devices and a SCSI bus (See rejection of claim 1 above)

Pacheco does not explicitly teach wherein transmitting information indicative of the time required for an initialization of a respective one of the at least two peripheral devices from each of the at least two peripheral devices via a bus to the host device is performed in an open drain mode of the bus.

However, Vander Kamp teaches that SCSI devices operate according to the SCSI-I or SCSI-II bus protocols (Vander Kamp; Col 5 Lines 39 – 40). The SCSI-I bus protocol is an open drain mode bus protocol.

Therefore, it would have been obvious to one of ordinary skill in the art at the time the invention was made to have modified the teachings Pacheco to include the open drain mode because doing so is well known when using SCSI devices (Vander Kamp; Col 5 Lines 39 – 40).

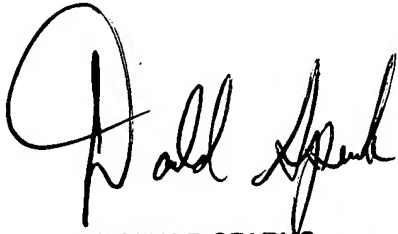

### ***Conclusion***

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Richard Franklin whose telephone number is (571) 272-0669. The examiner can normally be reached on M-F.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Donald Sparks can be reached on (571) 272-4201. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.

Information regarding the status of an application may be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for published applications may be obtained from either Private PAIR or Public PAIR. Status information for unpublished applications is available through Private PAIR only. For more information about the PAIR system, see <http://pair-direct.uspto.gov>. Should you have questions on access to the Private PAIR system, contact the Electronic Business Center (EBC) at 866-217-9197 (toll-free). If you would like assistance from a USPTO Customer Service Representative or access to the automated information system, call 800-786-9199 (IN USA OR CANADA) or 571-272-1000.
